Reflection CSC360 Lecture 2

Maven & JavaFX Setup

- Learn how Maven automates project builds and handles Java dependencies without manual downloads.
- Understand how to run Maven JavaFX projects within IntelliJ IDEA.
- Get familiar with the default file layout of a Maven-based JavaFX application.

JavaFX Shape Rendering & Styling

- Know how to instantiate and render basic 2D shapes, such as Rectangle.
- Differentiate between solid fill and outline-only rendering.
- Use setFill() for inner color and setStroke() for outline color.
- Apply Color.TRANSPARENT to create hollow shapes.
- Control border thickness using setStrokeWidth().

Shape Positioning & Sizing

- Use setLayoutX() and setLayoutY() to place elements on the screen.
- Set shape dimensions using setWidth() and setHeight().
- Grasp how adjustments to layout and dimensions alter object rendering.

Practical Exercise

- Build a simple Maven-backed JavaFX application.
- Draw a standard square using the Rectangle class.
- Convert the square into a hollow shape with a defined border color and width.
- Tweak sizing, placement, and stroke settings to observe graphical changes.
